

HarmonicPlanetary® HPG Standard Series

Size

11, 14, 20, 32, 50, 65

6
Sizes

Peak torque

5Nm – 3200Nm

Reduction ratio

Single Stage: 3:1 to 9:1, Two Stage: 11:1 to 50:1

Low Backlash

Standard: <3 arc-min Optional: <1 arc-min
Low Backlash for Life

Innovative ring gear automatically adjusts for backlash, ensuring consistent, low backlash for the life of the gearhead. The ring gear design automatically provides the optimum backlash in the planetary gear train and maintains the same low backlash for the life of the gearhead.

High efficiency

Up to 95%

High Load Capacity Output Bearing

A Cross Roller bearing is integrated with the output flange to provide high moment stiffness, high load capacity and precise positioning accuracy.

Easy mounting to a wide variety of servomotors

Quick Connect™ coupling

*1: Rated torque is based on L₅₀ life of 20,000 hours at rated input speed.

*2: The limit for torque during start and stop cycles.

*3: The limit for torque during emergency stops or from external shock loads. Always operate below this value. Calculate the number of permissible events to ensure it meets required operating conditions.

*4: Maximum average input speed is limited by heat generation in the speed reducer assuming a continuous operating speed or the average input speed of a motion profile. The actual limit for average input speed depends on the operating environment.

*5: Maximum instantaneous input speed.

*6: The mass is for the gearhead only (without input shaft coupling & motor flange). Please contact us for the mass of your specific configuration.

*7: Flange output is standard for the size 65 gearhead. Shaft type (J2 & J6) is also available. Note: Never rely on these values as a margin in a system that must hold an external load. A brake must be used where back driving is not permissible.

50	70	7.1	35	3.6	64	6.6				

*1: Accuracy values represent the difference between the theoretical angle and the actual angle of output for any given input. The values in the table are maximum values.

θ_{er} : Accuracy
 θ_1 : Input angle
 θ_2 : Actual output angle
 R : Gear reduction ratio

$$\theta_{er} = \theta_2 - \frac{\theta_1}{R}$$

Figure 032-1

*2: The repeatability is measured by moving to a given theoretical position seven times, each time approaching from the same direction. The actual position of the output shaft is measured each time and repeatability is calculated as the 1/2 of the maximum difference of the seven data points. Measured values are indicated in angles (arc-sec) prefixed with "±". The values in the table are maximum values.

Figure 032-2

*3: Starting torque is the torque value applied to the input side at which the output first starts to rotate. The values in the table are maximum values.

Table 032-2

Load	No load
HPG speed reducer surface temperature	25°C

*4: Backdriving torque is the torque value applied to the output side at which the input first starts to rotate. The values in the table are maximum values.

Note: Never rely on these values as a margin in a system that must hold an external load. A brake must be used where back driving is not permissible.

Table 032-3

Load	No load
HPG speed reducer surface temperature	25°C

*5: No-load running torque is the torque required at the input to operate the gearhead at a given speed under a no-load condition. The values in the table are average values.

Harmonic Planetary
 HPG Series
 High-Performance Gearhead for Servomotors

Torsional stiffness curve

With the input of the gear locked in place, a torque applied to the output flange will torsionally deflect in proportion to the applied torque. We generate a torsional stiffness curve by slowly applying torque to the output in the following sequence:

- (1) Clockwise torque to TR,
- (2) Return to Zero,
- (3) Counter-Clockwise torque to -TR,
- (4) Return to Zero and
- (5) again Clockwise torque to TR.

A loop of (1) > (2) > (3) > (4) > (5) will be drawn as in Fig. 033-1. The torsional stiffness in the region from "0.15 x TR" to "TR" is calculated using the average value of this slope. The torsional stiffness in the region from "zero torque" to "0.15 x TR" is lower. This is caused by the small amount of backlash plus engagement of the mating parts and loading of the planet gears under the initial torque applied.

Calculation of total torsion angle

The method to calculate the total torsion angle (average value) on one side when the speed reducer applies a load in a no-load state.

Formula 033-1

● Calculation formula

$$\theta = D + \frac{T - T_L}{A/B}$$

θ	Total torsion angle	—
D	Torsion angle on one side at output torque x 0.15 torque	See Fig. 033-1, Table 033-1, Table 033-2
T	Load torque	—
T _L	Output torque x 0.15 torque (=TRx0.15)	See Fig. 033-1
A/B	Torsional stiffness	See Fig. 033-1, Table 033-1 to 2

Backlash (Hysteresis loss)

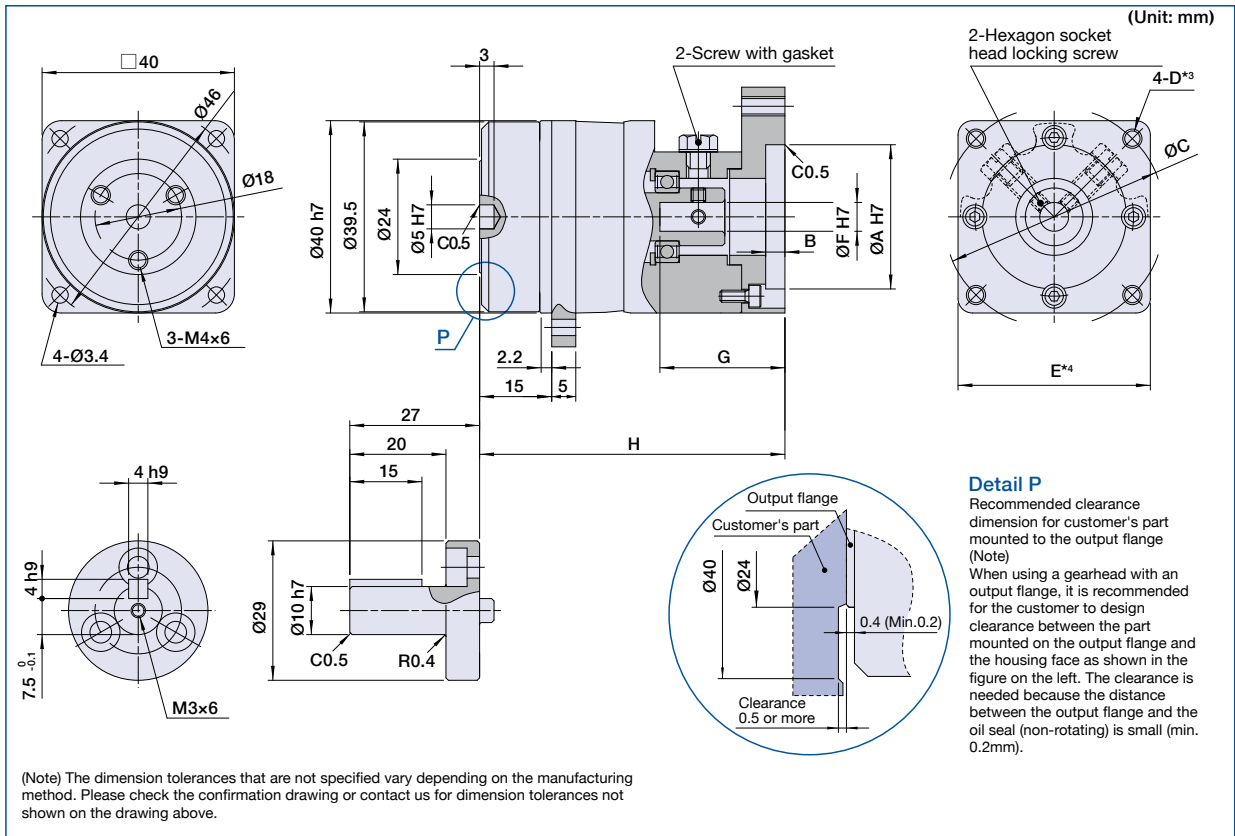

The vertical distance between points (2) & (4) in Fig. 033-1 is called a hysteresis loss. The hysteresis loss between "Clockwise load torque TR" and "Counter Clockwise load torque -TR" is defined as the backlash of the HPG series. Backlash of the HPG series is less than 3 arc-min (1 arc-min or less for a reduced backlash option).

HPG-11 Outline Dimensions

Only primary dimensions are shown in the drawings below. Refer to the confirmation drawing for detailed dimensions.

Figure 034-1

Dimension Table

(Unit: mm) Table 034-1

	Flange	Coupling	A (H7)		B	C		F (H7)		G		H * ¹	K	Mass (kg) * ²	
			Min.	Max.	Max.	Min.	Max.	Min.	Max.	Min.	Max.	Typical		Shaft	Flange
Single Stage	Type I	1	20	50	4	28	70	5	8	17.5	26	54.5	21	0.34	0.30
Two Stage	Type I	1	20	50	4	28	70	5	8	17.5	26	63.5	30	0.34	0.30

Refer to the confirmation drawing for detailed dimensions. Dimensions of typical products are shown. Please contact us for other mounting options if the configurations shown above are not suitable for your particular motor.

*1 May vary depending on motor interface dimensions.

*2 The mass will vary slightly depending on the ratio and on the inside diameter of the input shaft coupling.

*3 Tapped hole for motor mounting screw.

*4 E dimension is dependent on motor selection.

Product Sizing & Selection

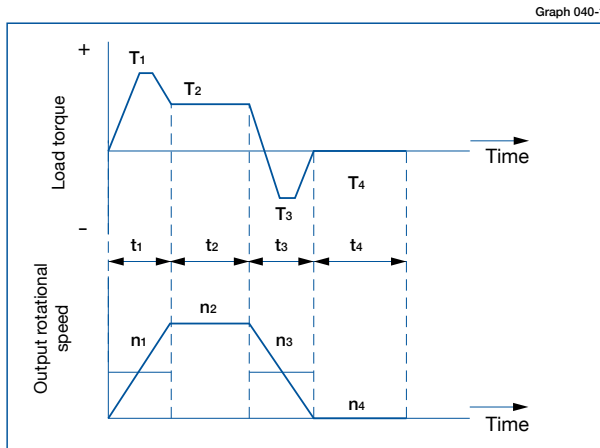

To fully utilize the excellent performance of the HPG HarmonicPlanetary® gearheads, check your operating conditions and, using the flowchart, select the appropriate size gear for your application.

In general, a servo system rarely operates at a continuous load and speed. The input speed, load torque change and a comparatively large torque is applied during start and stop. Unexpected impact torques may also be applied.

Check your operating conditions against the following load torque pattern and select a suitable size based on the flowchart shown on the right. Also check the life and static safety coefficient of the cross roller bearing and input side main bearing (input shaft type only).

Checking the load torque pattern

Review the load torque pattern. Check the specifications shown in the figure below.

Obtain the value of each load torque pattern.

Load torque	T ₁ to T _n (Nm)
Time	t ₁ to t _n (sec)
Output rotational speed	n ₁ to n _n (rpm)

<Normal operation pattern>

Starting	T ₁ , t ₁ , n ₁
Steady operation	T ₂ , t ₂ , n ₂
Stopping (slowing)	T ₃ , t ₃ , n ₃
Idle	T ₄ , t ₄ , n ₄

<Maximum rotational speed>

Max. output rotational speed	$no_{max} \geq n_1$ to n_n
Max. input rotational speed (Restricted by motors)	$ni_{max} n_1 \times R$ to $n_n \times R$
	R: Reduction ratio

<Impact torque>

When impact torque is applied T_s

<Required life>

$$L_{50} = L \text{ (hours)}$$

Flowchart for selecting a size

Please use the flowchart shown below for selecting a size. Operating conditions must not exceed the performance ratings.

Calculate the average load torque applied on the output side from the load torque pattern: T_{av} (Nm).

$$T_{av} = \sqrt[10/3]{\frac{|n_1| \cdot t_1 \cdot |T_1|^{10/3} + |n_2| \cdot t_2 \cdot |T_2|^{10/3} + \dots + |n_n| \cdot t_n \cdot |T_n|^{10/3}}{n_1 \cdot t_1 + n_2 \cdot t_2 + \dots + n_n \cdot t_n}}$$

Calculate the average output speed based on the load torque pattern: no_{av} (rpm)

$$no_{av} = \frac{|n_1| \cdot t_1 + |n_2| \cdot t_2 + \dots + |n_n| \cdot t_n}{t_1 + t_2 + \dots + t_n}$$

Make a preliminary model selection with the following condition: $T_{av} \leq$ Average load torque (Refer to rating table). ● NG

Determine the reduction ratio (R) based on the maximum output rotational speed (no_{max}) and maximum input rotational speed (ni_{max}).

$$\frac{ni_{max}}{no_{max}} \geq R$$

(A limit is placed on ni_{max} by motors.)
Calculate the maximum input speed (ni_{max}) from the maximum output speed (no_{max}) and the reduction ratio (R).
 $ni_{max} = no_{max} \cdot R$

Calculate the average input speed (ni_{av}) from the average output speed (no_{av}) and the reduction ratio (R): $ni_{av} = no_{av} \cdot R \leq$ Max. average input speed (nr). ● NG

Check whether the maximum input speed is equal to or less than the values in the rating table.
 $ni_{max} \leq$ maximum input speed (rpm) ● NG

Check whether T₁ and T₃ are within peak torques (Nm) on start and stop in the rating table. ● NG

Check whether T_s is equal to or less than the momentary max. torque (Nm) value from the ratings. ● NG

Calculate the lifetime and check whether it meets the specification requirement.

T_r: Output torque
n_r: Max. average input speed

$$L_{50} = 20,000 \cdot \left(\frac{T_r}{T_{av}}\right)^{10/3} \cdot \left(\frac{n_r}{ni_{av}}\right) \text{ (Hour)}$$

The model number is confirmed.

Caution

If the expected operation will result in conditions where:
i) Actual average load torque (T_{av}) > Permissible maximum value of average load torque or
ii) Actual average input rotational speed (ni_{av}) > Permissible average input rotational speed (nr), then please check its effect on the speed reducer temperature rise or other factors. Consider selecting the next larger speed reducer, reduce the operating loads or take other means to ensure safe use of the gear. Exercise caution especially when the duty cycle is close to continuous operation.

Refer to the Caution note below.

Review the operation conditions, size and reduction ratio.

Example of model number Selection

Value of each load torque pattern.

Load torque	T_n (Nm)	<Maximum rotational speed>	
Time	t_n (sec)	Max. output rotational speed	no max = 120 rpm
Output rotational speed	n_n (rpm)	Max. input rotational speed	ni max = 5,000 rpm (Restricted by motors)
<Normal operation pattern>			
Starting	$T_1 = 70$ Nm, $t_1 = 0.3$ sec, $n_1 = 60$ rpm	<Impact torque>	
Steady operation	$T_2 = 18$ Nm, $t_2 = 3$ sec, $n_2 = 120$ rpm	When impact torque is applied	$T_s = 180$ Nm
Stopping (slowing)	$T_3 = 35$ Nm, $t_3 = 0.4$ sec, $n_3 = 60$ rpm	<Required life>	
Idle	$T_4 = 0$ Nm, $t_4 = 5$ sec, $n_4 = 0$ rpm	$L_{50} = 30,000$ (hours)	

Calculate the average load torque applied to the output side based on the load torque pattern: T_{av} (Nm).

$$T_{av} = \sqrt[10/3]{\frac{|60\text{rpm}| \cdot 0.3\text{sec} \cdot |70\text{Nm}|^{10/3} + |120\text{rpm}| \cdot 3\text{sec} \cdot |18\text{Nm}|^{10/3} + |60\text{rpm}| \cdot 0.4\text{sec} \cdot |35\text{Nm}|^{10/3}}{|60\text{rpm}| \cdot 0.3\text{sec} + |120\text{rpm}| \cdot 3\text{sec} + |60\text{rpm}| \cdot 0.4\text{sec}}}$$

Calculate the average output speed based on the load torque pattern: no av (rpm)

$$\text{no av} = \frac{|60\text{rpm}| \cdot 0.3\text{sec} + |120\text{rpm}| \cdot 3\text{sec} + |60\text{rpm}| \cdot 0.4\text{sec} + |0\text{rpm}| \cdot 5\text{sec}}{0.3\text{sec} + 3\text{sec} + 0.4\text{sec} + 5\text{sec}}$$

Make a preliminary model selection with the following conditions. $T_{av} = 30.2$ Nm \leq 70 Nm. (HPG-20A-33 is tentatively selected based on the average load torque (see the rating table) of size 20 and reduction ratio of 33.)

● NG

OK

Determine a reduction ratio (R) from the maximum output speed (no max) and maximum input speed (ni max).

$$\frac{5,000 \text{ rpm}}{120 \text{ rpm}} = 41.7 \geq 33$$

Calculate the maximum input speed (ni max) from the maximum output speed (no max) and reduction ratio (R): $ni \text{ max} = 120 \text{ rpm} \cdot 33 = 3,960 \text{ rpm}$

Calculate the average input speed (ni av) from the average output speed (no av) and reduction ratio (R):
 $ni \text{ av} = 46.2 \text{ rpm} \cdot 33 = 1,525 \text{ rpm} \leq$ Max average input speed of size 20 3,000 rpm

● NG

OK

Check whether the maximum input speed is equal to or less than the values specified in the rating table.
 $ni \text{ max} = 3,960 \text{ rpm} \leq 5,000 \text{ rpm}$ (maximum input speed of size 20)

● NG

OK

Check whether T_1 and T_3 are within peak torques (Nm) on start and stop in the rating table.

$$T_1 = 70 \text{ Nm} \leq 117 \text{ Nm} \text{ (Limit for repeated peak torque, size 20)}$$

$$T_3 = 35 \text{ Nm} \leq 117 \text{ Nm} \text{ (Limit for repeated peak torque, size 20)}$$

● NG

OK

Check whether T_s is equal to or less than limit for momentary torque (Nm) in the rating table.
 $T_s = 180 \text{ Nm} \leq 217 \text{ Nm}$ (momentary max. torque of size 20)

● NG

OK

Calculate life and check whether the calculated life meets the requirement.

$$L_{50} = 20,000 \cdot \left(\frac{70 \text{ Nm}}{30.2 \text{ Nm}}\right)^{10/3} \cdot \left(\frac{3,000 \text{ rpm}}{1,525 \text{ rpm}}\right) = 648,413 \text{ (hours)} \geq 30,000 \text{ (hours)}$$

● NG

OK

The selection of model number HPG-20A-33 is confirmed from the above calculations.

Refer to the Caution note at the bottom of page 40.

Review the operation conditions, size and reduction ratio.

HarmonicPlanetary[®] HPGP / HPG Series

The thin wall flexible gear technology used for HarmonicDrive[®] gearing is applied to the internal gear of our planetary gear speed reducers. It allows the internal gear to deform elastically thus maintaining low backlash for the life of the gearhead, without the need for adjustment.

Planetary gears have simultaneous meshing between the sun gear and planet gears and between the planet gears and the internal gear. Some manufacturers try to reduce the backlash by controlling the dimensional precision of the parts, however this causes interference of meshing parts due to dimensional errors, resulting in uneven input torque and noise. Harmonic Planetary gears use a thin wall elastic internal gear which allows a preload of the gear and compensates for interference between meshing parts. The Harmonic Planetary[®] gear series incorporates this internal gear which maintains low backlash for the life of the speed reducer.

- ◆ **Low backlash: Less than 3 arc-min (Less than 1 arc-min also available)**
- ◆ **Low gear ratios, 3:1 to 50:1**
- ◆ **High efficiency**
- ◆ **High load capacity by integrating structure with cross roller bearing**
- ◆ **High-torque capacity**

Robust cross roller bearing and output flange are integrated to provide high moment stiffness, high load capacity and precise positioning accuracy.

The cross roller bearing output flange serves as the second stage carrier for a rugged, compact design.

Backlash compensating internal gear

Shielded or sealed input bearing

Motor mounting flange

Quick Connect™ coupling for easy mounting of any servomotor

Output Bearing Specifications and Checking Procedure

A precision cross roller bearing supports the external load (output flange).
Check the maximum load, moment load, life of the bearing and static safety coefficient to maximize performance.

Checking procedure

(1) Checking the maximum load moment load (M_{max})

Obtain the maximum load moment load (M_{max}). ●●▶ Maximum load moment load (M_{max}) ≤ Permissible moment (M_c)

(2) Checking the life

Obtain the average radial load (F_{rav}) and the average axial load (F_{aav}). ●●▶ Obtain the radial load coefficient (X) and the axial load coefficient (Y). ●●▶ Calculate the life and check it.

(3) Checking the static safety coefficient

Obtain the static equivalent radial load coefficient (P_o). ●●▶ Check the static safety coefficient. (f_s)

Specification of output bearing

HPGP/HPG Series Table 129-1, -2 and -3 indicate the specifications for gearhead, right angle and input shaft unit, and cross roller bearing.

Table 129-1

	(40)	17600	26300		
	(50)	18900	28200		

* The ratio specified in parentheses is for the HPG Series.

- *1 The basic dynamic load rating means a certain static radial load so that the basic dynamic rated life of the roller bearing is a million rotations.
- *2 The basic static load rating means a static load that gives a certain level of contact stress (4kN/mm²) in the center of the contact area between rolling element receiving the maximum load and orbit.
- *3 The allowable moment load is a maximum moment load applied to the bearing. Within the allowable range, basic performance is maintained and the bearing is operable. Check the bearing life based on the calculations shown on the next page.
- *4 The value of the moment stiffness is the average value.
- *5 The allowable radial load and allowable axial load are the values that satisfy the life of a speed reducer when a pure radial load or an axial load applies to the main bearing. (Lr + R = 0 mm for radial load and La = 0 mm for axial load) If a compound load applies, refer to the calculations shown on the next page.

How to calculate the maximum load moment load

- HPGP
- HPG
- CSG-GH
- CSF-GH
- HPF

Maximum load moment load (M_{max}) is obtained as follows. Make sure that $M_{max} \leq Mc$.

Formula 131-1

$$M_{max} = Fr_{max}(L_r + R) + Fa_{max} L_a$$

Fr_{max}	Max. radial load	N (kgf)	See Fig. 131-1.
Fa_{max}	Max. axial load	N (kgf)	See Fig. 131-1.
L_r, L_a	—	m	See Fig. 131-1.
R	Offset amount	m	See Fig. 131-1. See "Specification of main bearing" of each series

How to calculate the radial load coefficient and the axial load coefficient

- HPGP
- HPG
- CSG-GH
- CSF-GH
- HPF

The radial load coefficient (X) and the axial load coefficient (Y)

Formula 131-2

Formula	X	Y
$\frac{Fa_{av}}{Fr_{av} + 2(Fr_{av}(L_r + R) + Fa_{av} \cdot L_a) / dp} \leq 1.5$	1	0.45
$\frac{Fa_{av}}{Fr_{av} + 2(Fr_{av}(L_r + R) + Fa_{av} \cdot L_a) / dp} > 1.5$	0.67	0.67

Fr_{av}	Average radial load	N (kgf)	See "How to obtain the average load."
Fa_{av}	Average axial load	N (kgf)	See "How to obtain the average load."
L_r, L_a	—	m	See Fig. 131-1.
R	Offset amount	m	See Fig. 131-1. See "Output Shaft Bearing Specifications" of each series.
dp	Circular pitch of roller	m	See Fig. 131-1. See "Output Shaft Bearing Specifications" of each series.

How to calculate the average load (Average radial load, average axial load, average output rotational frequency)

- HPGP
- HPG
- CSG-GH
- CSF-GH
- HPF

If the radial load and the axial load fluctuate, they should be converted into the average load to check the life of the cross roller bearing.

How to obtain the average radial load (Fr_{av}) Formula 131-3

$$Fr_{av} = \sqrt[10/3]{\frac{n_1 t_1 (|Fr_1|)^{10/3} + n_2 t_2 (|Fr_2|)^{10/3} + \dots + n_n t_n (|Fr_n|)^{10/3}}{n_1 t_1 + n_2 t_2 + \dots + n_n t_n}}$$

Note that the maximum axial load within the t_1 section is Fr_1 and the maximum axial load within the t_3 section is Fr_3 .

How to obtain the average axial load (Fa_{av}) Formula 131-4

$$Fa_{av} = \sqrt[10/3]{\frac{n_1 t_1 (|Fa_1|)^{10/3} + n_2 t_2 (|Fa_2|)^{10/3} + \dots + n_n t_n (|Fa_n|)^{10/3}}{n_1 t_1 + n_2 t_2 + \dots + n_n t_n}}$$

Note that the maximum axial load within the t_1 section is Fr_1 and the maximum axial load within the t_3 section is Fr_3 .

How to obtain the average output rotational frequency (N_{av}) Formula 131-5

$$N_{av} = \frac{n_1 t_1 + n_2 t_2 + \dots + n_n t_n}{t_1 + t_2 + \dots + t_n}$$

How to calculate the life HPGP HPG CSG-GH CSF-GH HPF

Calculate the life of the cross roller bearing using Formula 132-1. You can obtain the dynamic equivalent radial load (P_c) using Formula 132-2.

Formula 132-1

$$L_{10} = \frac{10^6}{60 \times N_{av}} \times \left(\frac{C}{f_w \cdot P_c} \right)^{10/3}$$

L₁₀	Life	hour	—
N_{av}	Ave. output speed	rpm	See "How to calculate the ave. load."
C	Basic dynamic rated load	N (kgf)	See "Output Bearing Specs."
P_c	Dynamic equi. radial load	N (kgf)	See Formula 132-2.
f_w	Load coefficient	—	See Table 132-1.

Formula 132-2

$$P_c = X \cdot \left(Fr_{av} + \frac{2(Fr_{av}(L_r + R) + Fa_{av} \cdot La)}{dp} \right) + Y \cdot Fa_{av}$$

Fr_{av}	Average radial load	N (kgf)	See "How to calculate the ave. load."
Fa_{av}	Average axial load	N (kgf)	
dp	Circular pitch of roller	m	See "Output Bearing Specs."
X	Radial load coefficient	—	See "How to calculate the radial load coefficient and the axial load coefficient."
Y	Axial load coefficient	—	
L_r, La	—	m	See Figure 131-1. See "External load influence diagram."
R	Offset amount	m	See Figure 131-1. See "External load influence diagram" and "Output Bearing Specs" of each series.

Load coefficient Table 132-1

Load status	f _w
During smooth operation without impact or vibration	1 to 1.2
During normal operation	1.2 to 1.5
During operation with impact or vibration	1.5 to 3

How to calculate the life during oscillating movement HPGP HPG CSG-GH CSF-GH HPF

Calculate the life of the cross roller bearing during oscillating movement by Formula 132-3.

Formula 132-3

$$L_{oc} = \frac{10^6}{60 \times n_1} \times \frac{90}{\theta} \times \left(\frac{C}{f_w \cdot P_c} \right)^{10/3}$$

L_{oc}	Rated life under oscillating movement	hour	—
n₁	No. of reciprocating oscillation per min.	cpm	—
C	Basic dynamic rated load	N (kgf)	See "Output Bearing Specs."
P_c	Dynamic equivalent radial load	N (kgf)	See Formula 132-2.
f_w	Load coefficient	—	See Table 132-1.
θ	Oscillating angle /2	Deg.	See Figure 132-1.

Note When it is used for a long time while the rotation speed of the output shaft is in the ultra-low operation range (0.02rpm or less), the lubrication of the bearing becomes insufficient, resulting in deterioration of the bearing or increased load in the driving side. When using it in the ultra-low operation range, contact us.

How to calculate the static safety coefficient HPGP HPG CSG-GH CSF-GH HPF

In general, the basic static rated load (C_0) is considered to be the permissible limit of the static equivalent load. However, obtain the limit based on the operating and required conditions. Calculate the static safety coefficient (f_s) of the cross roller bearing using Formula 132-4.

General values under the operating condition are shown in Table 132-2. You can calculate the static equivalent radial load (P_0) using Formula 132-5.

Formula 132-4

$$f_s = \frac{C_0}{P_0}$$

C₀	Basic static rated load	N (kgf)	See "Output Bearing Specs."
P₀	Static equivalent radial load	N (kgf)	See Formula 132-5.

Formula 132-5

$$P_0 = Fr_{max} + \frac{2M_{max}}{dp} + 0.44Fa_{max}$$

Fr_{max}	Max. radial load	N (kgf)	
Fa_{max}	Max. axial load	N (kgf)	See "How to calculate the max. load moment load."
M_{max}	Max. load moment load	Nm (kgfm)	
dp	Circular pitch of roller	m	See "Output Bearing Specs" of each series.

Static safety coefficient Table 132-2

Load status	f _s
When high rotation precision is required	≧ 3
When impact or vibration is expected	≧ 2
Under normal operating condition	≧ 1.5

Input Bearing Specifications and Checking Procedure

Check the maximum load and life of the bearing on the input side if the reducer is an HPG input shaft unit or an HPF hollow shaft unit.

Checking procedure HPG HPF

(1) Checking maximum load

Calculate:

Maximum load moment load (Mi_{max})
 Maximum load axial load (Fai_{max})
 Maximum load radial load (Fri_{max})

Maximum load moment load (Mi_{max}) \leq Permissible moment load (Mc)
 Maximum load axial load (Fai_{max}) \leq Permissible axial load (Fac)
 Maximum load radial load (Fri_{max}) \leq Permissible radial load (Frc)

(2) Checking the life

Calculate:

Average moment load (Mi_{av})
 Average axial load (Fai_{av})
 Average input speed (Ni_{av})

Calculate the life and check it.

Specification of input shaft bearing

The specification of the input side main bearing of the input shaft unit is shown below.

Specification of input shaft bearing HPG

Table 133-1

Size	Basic rated load			
	Basic dynamic rated load Cr		Basic static rated load Cor	
	N	kgf	N	kgf
11	2700	275	1270	129

	Nm	kgfm	N	kgf	N	kgf
25	10	1.02	1538	157	522	53.2
32	19	1.93	3263	333	966	98.5

(Note: Table 133-2 and 133-4)

*1 The allowable axial load is the tolerance of an axial load applied to the shaft center.

*2 The allowable radial load of HPG series is the tolerance of a radial load applied to the shaft length center.

*3 The allowable radial load of HPG series is the tolerance of a radial load applied to the point of 20 mm from the shaft edge (input flange edge).

Calculating maximum load moment load to input shaft

The maximum load moment load ($M_{i max}$) is calculated as follows. Check that the following formulas are established in all circumstances:

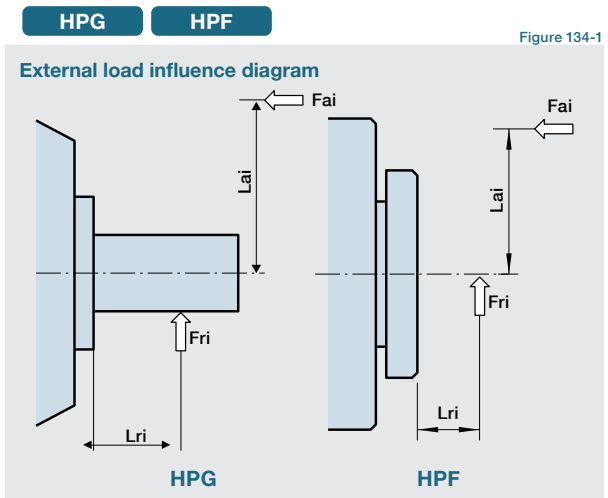

Formula 134-1

$$M_{i max} = F_{ri max} \cdot L_{ri} + F_{ai max} \cdot L_{ai}$$

$F_{ri max}$	Max. radial load	N (kgf)	See Fig. 134-1.
$F_{ai max}$	Max. axial load	N (kgf)	See Fig. 134-1.
L_{ri}, L_{ai}	-----	m	See Fig. 134-1.

$$M_{i max} \leq M_c \text{ (Permissible moment load)}$$

$$F_{ai max} \leq F_{ac} \text{ (Permissible axial load)}$$

How to calculate average load (Average moment load, average axial load, average input rotational frequency)

If moment load and axial load fluctuate, they should be converted into the average load to check the life of the bearing.

How to calculate the average moment load ($M_{i av}$)

Formula 134-2

$$M_{i av} = \sqrt[3]{\frac{n_1 t_1 (|M_{i1}|)^3 + n_2 t_2 (|M_{i2}|)^3 + \dots + n_n t_n (|M_{in}|)^3}{n_1 t_1 + n_2 t_2 + \dots + n_n t_n}}$$

How to calculate the average axial load ($F_{ai av}$)

Formula 134-3

$$F_{ai av} = \sqrt[3]{\frac{n_1 t_1 (|F_{ai1}|)^3 + n_2 t_2 (|F_{ai2}|)^3 + \dots + n_n t_n (|F_{ain}|)^3}{n_1 t_1 + n_2 t_2 + \dots + n_n t_n}}$$

How to calculate the average output rotational frequency ($N_{i av}$)

Formula 134-4

$$N_{i av} = \frac{n_1 t_1 + n_2 t_2 + \dots + n_n t_n}{t_1 + t_2 + \dots + t_n}$$

Calculating life of input side bearing

Calculate the bearing life according to Calculation Formula 132-5 and check the life.

Formula 134-5

$$L_{10} = \frac{10^6}{60 \times N_{i av}} \times \left(\frac{C_r}{P_{ci}} \right)^3$$

L_{10}	Life	Hour	—
$N_{i av}$	Average input rotational speed	rpm	See Formula 134-4
C_r	Basic dynamic rated load	N (kgf)	See Table 133-1 and -3
P_{ci}	Dynamic equivalent radial load	N	See Table 134-1 and -2

Dynamic equivalent radial load

Table 134-1

Size	P_{ci}
11	$0.444 \times M_{i av} + 1.426 \times F_{ai av}$
14	$0.137 \times M_{i av} + 1.232 \times F_{ai av}$
20	$0.109 \times M_{i av} + 1.232 \times F_{ai av}$
32	$0.071 \times M_{i av} + 1.232 \times F_{ai av}$
50	$0.053 \times M_{i av} + 1.232 \times F_{ai av}$
65	$0.041 \times M_{i av} + 1.232 \times F_{ai av}$

Dynamic equivalent radial load

Table 134-2

Size	P_{ci}
25	$121 \times M_{i av} + 2.7 \times F_{ai av}$
32	$106 \times M_{i av} + 2.7 \times F_{ai av}$

$M_{i av}$ Average moment load Nm (kgfm) See Formula 134-2
 $F_{ai av}$ Average axial load N (kgf) See Formula 134-3
